

This Report was commissioned by Transport and Main Roads (TMR) for the purposes agreed between GHD and TMR as set out in section 1 of this Report. GHD otherwise disclaims responsibility to any person other than TMR arising in connection with this Report.

The services undertaken by GHD in connection with preparing this Report were limited to those specifically detailed in the Report and are subject to the scope limitations set out in the Report.

Our client TMR has advised that this Report may be used by delivering agencies (councils, facility owners and managers, port authorities and Transport and Main Roads) as one tool in a broader assessment process to choose and prioritise sites for development. The views expressed in this Report are not endorsed by Government or Cabinet policy positions. This Report should be used by the delivering agencies on an information only basis.

The opinions, conclusions and any recommendations in this Report are based on conditions encountered and information reviewed at the date of preparation of the Report. GHD has no responsibility or obligation to update this Report to account for events or changes occurring subsequent to the date that the Report was prepared.

The opinions, conclusions and any recommendations in this Report are based on limitations and assumptions made by GHD described in this Report. GHD disclaims liability arising from any of the assumptions being incorrect

Appendix B - Capacity assessment, existing facilities

Appendix C – Demand assessment (Economic Associates)

Definitions

'all-tide' means that a vessel can be realistically launched into or retrieved from the waterway at the site for 100% of the tidal range

'ARI' means average recurrence interval, and refers to the average or expected time period between two occurrences of weather exceeding a certain magnitude

'capacity' means the ability to handle throughput for boat ramps, or the ability to handle multiple vessels at pontoons and floating walkways

'CHMP' means Cultural Heritage Management Plan

'CPM Reg' means the Coastal Protection and Management Regulation 2003

'CTU' means 'car-trailer unit', and applies to parking bays suitable for use by a tow vehicle with attached boat trailer

'DEE' means the Department of the Environment and Energy (Commonwealth)

'demand' means the current or projected requirement at a given year to service the needs of the recreational boating community – assuming full effectiveness of existing facilities and based on current numbers of registered recreational boats only. Excludes non-registered vessels such as canoes, kayaks, sail-boards, row boats, powered vessels not requiring registration, etc.

'effective capacity' for a boat ramp means the number of lanes for boat ramps after adjusting for usage constraints such as the lack of adequate parking or tidal accessibility, or improvements to efficiency such as floating walkways or pontoons, see section 4.1.1 for additional detail

'effective capacity' for a landing means the number of landings after adjusting for usage constraints caused by tidal and depth restrictions, see section 4.2.1 for additional detail

'DEHP' means the Department of Environment and Heritage Protection

'EPBC Act' means the Environment Protection and Biodiversity Conservation Act 1999 (Cwlth)

'FHA' means Fish Habitat Area

'GBR' means Great Barrier Reef

'IDAS' means Integrated Development Assessment System

'landings' means jetty and pontoon structures that facilitate direct berthing of non-trailable vessels (keel boats and >8.0m powerboats), transient vessels and/or tenders from larger vessels (where effective anchoring or mooring is available nearby)

'land-side' refers to infrastructure constructed above high water mark

'LGA' means local government area

'MCU' means a material change of use under the planning scheme

'MIIP' means the TMR works program known as the Marine Infrastructure Investment Program, with the government's Marine Infrastructure Fund forming its capital component

'MNES' means matter of national environmental significance under the EPBC Act

'NC Act' means the Nature Conservation Act 1992

'near all-tide' means that a vessel can be realistically launched into or retrieved from the waterway at the site for at least 80% of the tidal range

'NNTT" means National Native Title Tribunal

'P Act' means the Planning Act 2016

'P Reg' means the Planning Regulation 2017

'part-tide' means that a vessel can be realistically launched into or retrieved from the waterway at the site for at least 50% of the tidal range

'registration activation rate' means the percentage of registered vessels liable to be in use on any given good weather weekend day

'shd' means schedule

'shortfall' means the outstanding number of boat ramp lanes or landings as appropriate (assuming announced TMR projects/upgrades at December 2016 have been built) required to satisfy demand at a particular year, after adjustment for actual number and effective capacity considerations. A negative number for shortfall in a table signifies an oversupply

'SPL' means strategic port land

'Study' means this document including appendices and the state-wide summary

'TMR' means the Department of Transport and Main Roads

'water-side' refers to infrastructure constructed below high water mark

'WHA' means World Heritage Area

means 'number' when used in tables

Executive summary

This study sets out the current and future demand for publicly accessible recreational boating facilities within the Bundaberg Regional Council area over the next 20 years. The assessment considers facilities for vessels, such as boat ramps and floating walkways, as well as landings for deep-draught vessels. It is intended to be used to inform funding priorities from 2018-19 onwards.

Key issues for Bundaberg Regional Council

The primary issues raised by stakeholders around access to recreational boating facilities in the Bundaberg Regional Council area centred on:

- accessibility under a range of tide and weather conditions
- capacity.

Demand assessment

The demand assessment is based on boat registrations from within the local government area (LGA) of Bundaberg and surrounding LGAs. The demand assessment is analysed against existing capacity to produce an outstanding shortfall projection. Key aspects influencing demand considered in the assessment are that:

- The population of Bundaberg Regional Council is projected to increase from 94,453
 persons in 2016 to 116,082 persons in 2036, or by 1.0% per annum, below the state-wide
 five year forecast average of 1.6% (Appendix C).
- Boat registrations are highest for boats up to 4.5 metres in length.
- Trailable and non-trailable vessel registrations within the Bundaberg LGA are mostly used on the water within the LGA, with some leakage/export in usage from the LGA to Fraser Coast Regional Council and Gladstone Regional Council areas.
- Vessel inflows from outside the LGA are likely from North Burnett Regional Council,
 Fraser Coast Regional Council and Gladstone Regional Council.
- The registration activation rate from residents of the LGA is anticipated to be high (12%)
 as a result of a relatively high incidence of blue collar workers and higher average age
 than the Queensland state average.

Boat ramps

At present there are 19 boat ramp facilities in the LGA, containing 33 boat ramp lanes, however the lack of parking for car-trailer units (CTU) or limited tidal access at some locations means that the effective capacity of these ramps is 23.2 lanes.

To address any shortfall between demand and current capacity, existing facilities were further assessed to identify what type of access the facility provides to the two main destinations, being either open-water or non-open-water. This then allows identification of the type of additional facilities needed to address demand.

The projected boat ramp lane shortfall for Bundaberg is shown in Table 1.

Table 1 - Projected boat ramp lane shortfall, Bundaberg Regional Council

.Evaluation	Existing effective capacity*			2021		2026		2036	
category*y		Demand	Shortfall	Demand	Shortfall	Demand	Shortfall	Demand	Shortfall
Open- water access	10.5	13.5	3	15.3	4.8	15.7	5.2	17.5	7
Non- open- water access	12.7	13.5	0.8	14.7	2	15.3	2.6	16.5	3.8
Total	23.2	27	3.8	30	6.8	31	7.8	34	10.8

^{*}Refer section 4.1.2 and Table 6 for detailed evaluation categories

Landings

The assessment of capacity and shortfall in landings is shown in Table 2 and Table 3.

Table 2 - Existing landing capacity, Bundaberg Regional Council

Evaluation category	Existing effective capacity
# of public sheltered mainland landings*	4
# of public island landings – supplies available	0
# major private landings*	2
Total	6
Facilities not contributing to recreational capacity:	
# of public unsheltered mainland landings	0
# of public island landings – no supplies available	0

^{*}public sheltered mainland landings include the Buxton and Elliot Heads pontoons, Targo Street pontoon in Bundaberg and the Burnett Heads Boat Harbour jetty

Table 3 - Projected landing shortfall, Bundaberg Regional Council

	. Evaluation category	Existing	20	16	20	21	20	26	20	36
		effective capacity*	Demand	Shortfall	Demand	Shortfall	Demand	Shortfall	Demand	Shortfall
Ī	# of landings*	6	3	-3	3	-3	3	-3	3	-3

^{*#} of landings consists of public sheltered mainland landings, public island landings – supplies available and major private landings

This assessment indicates that at present the public landings network in conjunction with the supplementary capacity provided by commercial or club landings is adequate to cater for existing demand.

Recommended priorities

Refer to Table 4 for the Bundaberg Regional Council area recommended priorities.

^{*}Existing effective capacity includes MIIP announced projects/upgrades as at December 2016

^{*}See Appendix B and Table 6 for capacity assessment

^{*}private landings include marinas and clubs, accessible by fee for deep-draught vessels, and by arrangement, limited access for tender dinghies (varies with private entity, some free)

Recommended priorities to increase capacity and meet demand have been defined over the following time scales:

Priority 1 (P1) These sites are needed to meet existing demand.
Priority 2 (P2) Assuming that the priority 1 sites are implemented, these sites are expected to be needed to meet additional demand over the five years ending 2021.
Priority 3 (P3) Assuming that the priority 1 and 2 sites are implemented, these sites are expected to be needed to meet additional demand over the subsequent five years, that is 2021 to 2026.
Priority 4 (P4) These sites are those that will meet future demand, but are not expected to be required before 2026 in demand terms but may be brought forward for construction for other reasons.

Table 4 - Recommended priorities to increase capacity, Bundaberg Regional Council area

Priority	Sites
Priority 1 (as soon as possible)	Burnett Heads Boat Harbour – expand parking to achieve 20 additional CTU spaces.
	Strathdees Road, Four Knots Point – Conduct a feasibility study to determine if floating infrastructure is viable in this section of the Burnett River. If so, rebuild and widen ramp. Formalise the parking area to achieve 45 CTU spaces.
	Walkers Point, Woodgate – widen ramp to add a floating walkway and formalise parking to achieve 45 CTU spaces.
Priority 2 (over the next five years)	New facility at Elliot Heads – formalise unofficial facility to 2-lanes with a floating walkway and 45 CTU spaces.
Priority 3 (over the next five to ten years)	McGills Road, Kalkie – expand ramp to 4-lanes and increase parking to 90 CTU spaces. Conduct feasibility study to determine if a heavy duty pontoon is viable at the site.
Priority 4 (other)	Sandy Hook – expand parking by 45 additional CTU spaces.
	Booyan Ramp, Moore Park Beach – conduct a feasibility study to determine if the ramp can be reconstructed as near all-tide. If near all-tide access can be achieved, widen ramp to 2-lanes and formalise parking to approximately 30 CTU spaces.

1. Introduction

1.1 Background

GHD was commissioned by the Department of Transport and Main Roads (TMR) to establish the current and future demand for recreational boating facilities throughout Queensland. This resulting study is the *Recreational Boating Facilities Demand Forecasting Study 2017* (Study) and supersedes the 2011 study of similar name. The study replaces the *Recreational Boating Facilities Demand Forecasting Study 2016* by incorporating the results of the 2016 census.

The Study will be used to inform planning for the development of existing and new recreational boating facilities by a variety of agencies, including TMR, the Gold Coast Waterways Authority, local government, and port and water authorities. The Study is one tool in a broader assessment process to select and prioritise sites for development. Specifically, the Study is not binding in any way on the agencies it is designed to assist. The Study establishes demand and makes informed suggestions as to how the established demand might be addressed. The 2011 study, at December 2016, has had 66% of its recommendations adopted to a greater or lesser extent. A similar recommendation take-up rate may be expected from this Study.

This LGA report is one of a series of reports for the Study comprising LGA and state-wide components. The state-wide report details the Study background and provides an overview of demand for recreational boating facilities over the next 20 years throughout the state. The state-wide report complements individual reports for each local government area (LGA). Each LGA report identifies existing capacity, current and future demand, and potential opportunities for boating infrastructure within the LGA – with appropriate adjustment for interaction with adjacent LGAs.

1.2 Context

This LGA report has been prepared with a focus on in-water recreational facilities and infrastructure comprising boat ramps, floating walkways and landings within each LGA, which are publicly accessible by registered vessels. As car parking can significantly constrain the efficient use of a facility, it has been considered in the assessment. However, facilities used more than 50% of the time for commercial or public passenger transport (e.g. ferry terminals), private facilities (such as yacht clubs and marinas), and general recreational facilities such as canoe ramps and fishing platforms are not included as part of this study.

The types of infrastructure considered in the assessment of capacity are:

- boat ramps used for the launching and retrieval of vessels
- supporting infrastructure for the boat ramp:
 - queuing facilities (floating walkways, pontoons, queuing beaches)
 - parking for car-trailer units (CTUs)
- short-term landings accessible by deep-draught or non-trailable vessels on the outer face, or their tenders (for longer term tying up) on the inner/landward face or ends.

There may be instances where a public pontoon serves multiple purposes – as a short-term landing, as a tender tying up facility, and as a queuing facility for a boat ramp.

2. Local government area overview

The key characteristics and influences on recreational boating within the Bundaberg Regional Council area are that:

- The area is dominated by the key industry of agriculture.
- The population of Bundaberg Regional Council is projected to increase from 94,453 persons in 2016 to 116,082 persons in 2036, or by 1.0% per annum, below the state-wide five year forecast average of 1.6% (Appendix C).
- Windy weather reduces the annual number of days that are suitable for offshore boating.
- The LGA is considered to be a regional centre under the remoteness measures used by the Australian Bureau of Statistics.

3. Existing facilities

3.1 Overview of existing facilities

Within the Bundaberg Regional Council area, existing recreational boating facilities are owned and managed by several organisations, shown in Table 5.

Table 5 - Recreational boating facilities within Bundaberg Regional Council area

Infrastructure owner	Boat ı	amps	Landings	
	Facilities	Lanes	Pontoons	Jetties
TMR mainland (other than state boat harbour)	16	27	2	0
TMR mainland (state boat harbour)	1	4	0	1
TMR island	0	0	0	0
Bundaberg Regional Council	1	1	1	0
Sunwater	1	1	0	0
Private landings (marinas/clubs)	N/A	N/A	2	0
Total	19	33	5	1

A map indicating the location of existing facilities is included as Appendix A.

Appendix B contains a summary capacity assessment of these existing facilities.

Important or popular public boat ramp facilities are located at:

- Queen Street, Bundaberg (Burnett River)
- Harbour Esplanade, Burnett Heads Boat Harbour
- McIntosh Avenue, Riverview, Elliot Heads (Elliot River).

Existing ramp facilities (including minor ones not mentioned above):

- service Bundaberg and the surrounding suburbs
- provide open-water access, or access to estuarine reaches of the numerous river and creek systems within the area – some facilities, including the Kalkie and Strathdees Road facilities, provide access to both
- provide freshwater access to river and dam systems.

Research referenced in the previous demand assessment study (GHD, 2011).¹ indicated that boat owners were prepared to travel up to approximately one hour to reach major or preferred marine infrastructure. In many locations, this infrastructure is represented by facilities that provide all-tide, or near all-tide, open-water access.

Between the NSW border and Port Douglas, TMR has therefore adopted a long term strategy to seek to provide access to an all-tide, sheltered facility, within a one-hour drive time where practical. Exceptions to the strategy include where all-tide, sheltered access is not feasible. In these instances, sites that provide near all-tide sheltered access are sought instead.

All-tide, open-water access is provided at the facilities at Fairymead, Kalkie, Strathdees Road (Four Knots Point) and the Burnett Heads Boat Harbour, at least one of which is within approximately a one-hour drive of main population areas in the LGA.

The public deep-draught vessel landings within the LGA comprise:

- a pontoon at Targo Street in Bundaberg, providing access to the Bundaberg central business district (CBD)
- pontoons at Buxton (Burrum River) and Elliot Heads (Elliot River), which offer tidedependent access
- a jetty in the Burnett Heads Boat Harbour, which may have been originally installed as a boat ramp queuing facility, however that demand is now met by a floating walkway.

3.2 Key issues and hotspots

The primary issues raised by stakeholders around access to recreational boating facilities in the Bundaberg Regional Council area are centred on accessibility and capacity.

3.2.1 Accessibility

A key issue raised by stakeholders is the ability to use existing facilities under a wide range of tide or weather conditions. At both Buxton and Elliot Heads, the ramps into the Burrum and Elliot rivers respectively, strong currents affect the launch and retrieval of boats and can make using the pontoon difficult. Launch and retrieval is further impacted by the rocky shoreline at both locations limiting the use of the shore as a queuing facility.

Additionally, the Woodgate beach ramp is on the open coast and therefore exposed to wind and wave action, reducing the availability of the ramp for launch and retrieval on all but "flat water days" (i.e. when the weather conditions are fine, with little to no wind and very little wave action).

3.2.2 Facilities capacity

Overcrowding at certain facilities was raised by stakeholders, particularly on "flat weather days" when demand for launch and retrieval facilities is very high. The facilities at Burnett Heads Boat Harbour, Strathdees Road at Four Knots Point and Elliot Heads were also noted as potentially underutilised on busy days due to insufficient parking for CTU's.

¹ GHD (2011) Recreational Boating Facilities Demand Forecasting Study. Report prepared for TMR, September.

4. Capacity assessment

4.1 Boat ramp capacity

The function of a boat ramp is to provide access for launching and retrieval of trailable vessels into a waterway. Alternative launching facilities such as boat stackers are outside scope for this Study.

4.1.1 Boat ramp capacity evaluation

For the purposes of this Study, boat ramp capacity is measured as "effective" boat ramp lanes. An effective boat ramp is quantitatively characterised as being:

- capable of accommodating 40 launch / retrievals per lane per day (in accordance with Australian Standard AS 3962² and Economic Associates (2011).³)
- supported by landside infrastructure such as queuing and manoeuvring areas
- supported by an appropriate number of CTU parking spaces.

The number of launch / retrievals per lane per day has been selected based on the relevant Australian Standard and Economic Associates (2011)³. This latter report summarised research undertaken by SKM (1988).⁴ and Rose et. al (2009).⁵, and stated that a rate of 30 boats per lane per day is considered to provide unhampered overall amenity, whereas a rate of 50 boats per lane per day represents congested operations; thus a midpoint of 40 launches / retrieves per day was selected to represent a balanced scenario.

TMR (2016).6 provides guidance on its standard/reference number of CTU spaces to match boat ramp lanes:

- 90 CTUs for four-lane ramps
- 70 CTUs for three-lane ramps
- 45 CTUs for two-lane ramps
- 15 CTUs for one-lane ramps with sealed road access
- 10 CTUs for one-lane ramps with all-weather, unsealed road access.

The above figures indicate an average relationship of 22.5 CTU spaces per "effective" lane. The TMR reference standards differ from the number of CTU spaces recommended for public boat launching ramps by AS 3962. That standard requires between 20 and 60 CTU spaces per ramp lane, depending on whether the ramp is in an urban or rural area, whether it has a queuing structure, and whether it has separate rigging and de-rigging areas. For local reasons, TMR may vary from these reference figures in particular cases.

The actual capacity, or "effectiveness" of a boat ramp is unique for each ramp, and is affected by:

• a reduction in the amount of time a ramp is available for use due to tidal variability, the seaward extent of ramp infrastructure, and navigable depths – at each ramp being

^{10 |} **GHD** | Report for Department of Transport and Main Roads - Queensland Recreational Boating Facilities Demand Forecasting Study 2017, 41/30098

measured as the % availability of the tidal range that a vessel can be realistically launched or retrieved – with ramps classified as all-tide (100%), near all-tide (>80%), and part-tide (50%) for access – and the reduction in availability occurring either:

- at the ramp itself, and/or
- in access channels connecting the ramp to the sea/open water (such as at a river mouth or other channel depth constraint)
- the exposure of the ramp to regular, and sometimes major, wave action these facilities tending to be beach ramps that are generally only suitable for short excursions in small boats in good weather and with suitable tides – accordingly these ramps are considered to be available only 50% of the time
- factors impacting efficient vessel launching and retrieval cycles, which include:
 - provision of queuing facilities such as pontoons, floating walkways or beaches with such queuing facilities increasing the capacity of a boat ramp by providing a place for a vessel to be secured during vehicle parking or retrieval without blocking a ramp lane, leading to greater throughput
 - constrained or difficult manoeuvring of vehicles and trailers onto the ramp
 - long distances between the boat ramp and CTU parking spaces
- the physical extent of infrastructure provided, such as:
 - the width and number of ramp lanes
 - the number of CTU parking spaces within the facility
 - provision for overflow parking during busy periods.

To calculate effective lanes at a boat ramp, the following adjustments have been applied to water-side infrastructure:

- all-tide no change (that is, multiplication factor of 1.0)
- near all-tide available 80% of the time (that is, multiplication factor of 0.8)
- part-tide available 50% of the time (that is, multiplication factor of 0.5)
- beach ramp available 50% of the time (that is, multiplication factor of 0.5)
- access to a queuing facility in the form of a floating walkway increase efficiency by 50% (that is, multiplication factor of 1.5)
- access to a queuing facility such as a gangway-access pontoon increase efficiency by 20% (that is, multiplication factor of 1.2).

Access to a beach, while convenient, is not suitable for all vessel sizes or preferred by some vessel owners, and therefore has not been considered to improve the capacity of a boat ramp.

As an example, the water-side effective lanes for a near all-tide, two-lane boat ramp with a floating walkway will be calculated as:

2	X	0.8	X	1.5	=	2.4
lanes		tidal		queuing		effective
		availability		structure		lanes

To calculate the land-side constraint on effective lanes, the following CTU groupings have been applied:

- 1 to 9 CTU 0.5 effective lanes
- 10 to 20 CTU 1 effective lane

- 21 to 29 CTU 1.5 effective lanes
- 30 to 39 CTU 1.8 effective lanes
- 40 to 54 CTU 2 effective lanes
- 55 to 64 CTU 2.5 effective lanes
- 65 to 75 CTU 3 effective lanes
- 76 to 83 CTU 3.5 effective lanes
- 84 to 97 CTU 4 effective lanes
- 98 to 105 CTU 4.5 effective lanes
- 106 to 117 CTU 5 effective lanes
- 118 to 127 CTU 5.5 effective lanes
- 128 to 140 CTU 6 effective lanes
- 141 to 149 CTU 6.5 effective lanes
- 150 to 157 CTU 7 effective lanes.

Unmarked or unformed parking areas are denoted accordingly. The number of CTU parking bays may also be the limiting factor on effective capacity, owing to the number of bays provided being less than the TMR reference standard.

The calculation is illustrated further in Appendix B, which details the actual and effective lanes for each facility.

The effective capacity of a facility is therefore limited by the constraining or "bottlenecking" element, and to realise full capacity a facility must balance the land-side and water-side capacities. The capacity assessment in Appendix B also identifies the limiting capacity constraint for each facility.

4.1.2 Boat ramp classification

As previously discussed, each boat ramp is subject to a unique set of constraints and opportunities, particularly in relation to tidal accessibility. To understand how well existing boat ramp facilities meet current demand, consideration has also been given to the recreational destination(s) accessed by each facility. Where available, this has been informed by local knowledge on actual usage.

Regardless of the tidal range available at the ramp itself, boat ramps typically seek to cater to one or more of the following destinations:

- access to the sea for fishing, diving, islands, jet skiing, and general recreation
- access to creeks and estuaries for fishing, crabbing, skiing and general recreation
- access to fresh water for fishing, skiing, jet skiing, and general recreation.

However, there are some practical limitations on the usage of a ramp for these purposes. These include:

- vessel size, as:
 - Small vessels are unsuitable for use in open and exposed waters under most conditions, although they may be taken into nearshore waters in calm conditions or for short journeys. These vessels are most suited to use in protected waterways such as creeks and estuaries.

- Large vessels suited to offshore use may be physically constrained in very narrow or shallow waterways, such as the upstream reaches of creeks or estuaries.
- travel time to destination, as:
 - Although navigable access from a boat ramp to open water may be possible, it may not be practical due to the distance travelled by water and/or any speed restrictions that may be in place for the waterway. Most people will seek to launch at the facility that takes the least time to reach their destination. This is particularly the case for offshore destinations where larger volumes of fuel must be paid for and carried to allow for the journey.

Discussions with local government stakeholders throughout the state indicated that vessels longer than 4.5m were generally used to access offshore areas, with smaller vessels tending to be used for creek and estuary access. There will be circumstances where smaller vessels will be used to travel offshore and larger vessels will stay in protected waters.

At facilities where open-water access becomes difficult, the Study assumes that the facility will be more frequently used for accessing local creeks, estuaries, and freshwater areas. Facilities have therefore been classified into one of the following categories to reflect the primary level of accessibility between the ramp and open water:

- open-water access all-tide access
- depth-limited access to open-water possible but navigation limited at certain stages of the tide by water depth, for example, crossing a tidal bar, or sand shoals in an estuary
- distance-limited access to open-water possible but limited by longer travel times between the ramp and open-water, for example due to long distances, or speed restrictions in the waterway – with, in some instances, depth also being a limitation but distance being considered as the main constraint
- infrastructure-limited access limited by configuration or size or nature of the infrastructure, for example, a low bridge preventing navigation
- beach ramps
- no open-water access access to open-water is not possible or practical, for example, a
 facility in a dam, or on the upstream side of a weir, barrage, or waterfall.

4.1.3 Existing capacity

The existing boat ramp facilities have been assessed individually to quantify their "effective" lane capacity. This assessment is presented in Appendix B and summarised in Table 6.

TMR's Marine Infrastructure Investment Program (MIIP) – at December 2016 – sets out the infrastructure planned and funded for implementation until the end of the 2017-18 financial year, and includes the government's Marine Infrastructure Fund capital projects. No specific projects are scheduled for implementation in the Bundaberg Regional Council area under the MIIP that seek to increase the capacity of marine infrastructure. Under this program the boat ramps at Burnett Heads Boat Harbour and Woodgate were upgraded in 2016 to extend the life of the ramps and improve safety for users.

Key observations drawn from this analysis include that:

- There is a reasonable balance in the Bundaberg LGA between facilities that provide access to open-water and those that provide access into estuaries or river/creek systems.
- There are no distance-limited, open-water access facilities.

 There are 33 actual lanes but only 23.2 effective lanes at present, reflecting limitations imposed by tidal restrictions and the lack of adequate parking. This is most evident for facilities that provide depth-limited open-water access, where there are currently 8 actual lanes but only 5.2 effective lanes.

Table 6 - Summary of existing boat ramp effective capacity by access type,

Bundaberg Regional Council

Facility		# facilities	limited by						
accessibility and tidal availability at the ramp	# of facilities	Water-side infrastructure	Land-side infrastructure	Actual # of lanes	Effective lanes

No open-water access	4	2	2	6	4				
Total	19	10	9	33	23.2				

4.2 Landing capacity for deep-draught vessels

The function of most landings is to provide short-term shore access for deep-draught vessels to facilitate the transfer of passengers, provisions, or to make short excursions to the shore via tender dinghy. Landings may be located on the coast or in navigable river systems within the LGA, but are of little use unless sheltered from on-shore winds and wave action.

For this Study, landings include jetty and pontoon structures that facilitate direct berthing of non-trailable vessels (keel boats and >8.0m powerboats), transient vessels, and/or tenders from larger vessels (where effective anchoring, berthing, or mooring is available nearby).

4.2.1 Capacity evaluation

The measurement of the recreational capacity of a landing is complex, as it is affected by:

- exposure of the landing to wind and wave conditions
- size and condition of the landing
- tidal availability

- the length of stay permitted
- enforcement practices
- competition from non-recreational boating users (such as authorised commercial users).

To accommodate these factors, landing capacity has been considered in the context of each landing's:

- contribution to a network of public landings within the LGA, and within a day's sail of a landing outside the LGA
- proximity to existing private/commercial recreational boat landings that accommodate visitors (such as those provided by yacht clubs)
- ability to service key destinations, such as access to basic provisions, key population areas or recreational destinations
- proximity to existing anchorage or mooring areas
- anecdotal usage.

4.2.2 Existing capacity - deep-draught vessel landings

Within the Bundaberg Regional Council area, there are four public landings that can be accessed by larger and deep-draught vessels for short-term stays (a couple of hours or less), as detailed in section 3.1.

Key observations indicate that:

- The Targo Street pontoon (Burnett River) is accessible to deep-draught vessels, providing access to the Bundaberg CBD. The pontoon is close to a popular anchorage and basic provisions and supplies are within walking distance.
- The Buxton pontoon is accessible by deep-draught vessels; however, the mouth of the Burrum River does not guarantee all-tide access. The pontoon also serves as a queuing structure for the adjacent boat ramp. There are amenities and barbeque facilities available as well as a nearby anchorage.
- Deep-draught access to the pontoon at Elliot Heads is tide-limited due to shallow depths
 in the mouth of the Elliot River, and is more frequently used as a queuing facility for the
 adjacent boat ramp.
- The jetty at the Burnett Heads Boat Harbour serves as a deep-draught vessel landing.
 Basic provisions are available within a one kilometre walk and marina facilities are available within the Harbour.

Although outside the scope of this study, key privately owned modern facilities within the LGA that also actively contribute to landing capacity include:

- Port of Bundaberg Marina (in the Burnett River)
- Burnett Heads Marina (in the Burnett Heads Boat Harbour).

The effective capacity of landings servicing the Bundaberg LGA is summarised in Table 7.

Table 7 - Existing landing capacity, Bundaberg Regional Council

Evaluation category	Existing effective capacity
# of public sheltered mainland landings	4
# of public island landings – supplies available	0
# major private landings	2
Total	6
Facilities not contributing to recreational capacity:	
# of public unsheltered mainland landings	0
# of public island landings – no supplies available	0

5. Demand assessment

The assessment of demand for recreational boating has been evaluated in terms of facilities for launching and retrieval of vessels (that is, boat ramps), and landings for short-term stays (generally less than a couple of hours) as follows:

- The demand for boat ramps is driven by trailable vessels that can access the ramp.
- Demand for landing facilities is focussed on providing a network of short term landings
 that service key land-side destinations (such as shops) of relevance or attraction to the
 boating community, with a particular focus on larger (non-trailable) vessels.

5.1 Boat ramp demand

The demand for boat ramps has been quantitatively evaluated using vessel registrations as the key indicator. The vessel registrations have been converted to an effective lane demand based on a typical boat ramp lane being able to accommodate 40 launch/retrieval manoeuvres per day.

The following section details the assessment of vessel registrations taking into consideration where vessels are likely to be used relative to where they are registered, and the demographics of the local area.

5.1.1 Registration distribution

People using the boat ramp facilities at a particular location are attracted to that facility by several factors, including:

- proximity to home
- road access (quality and distance)
- proximity to vessel destination (reef, open water, islands, creeks, estuary, fishing grounds, skiing areas, and so on)
- quality of the experience and ease of use (launching/retrieval, parking, security, complementary facilities, and so on).

This means that at many locations and at various times, ramp users will travel out of the LGA in which their vessel is registered to use boat ramp facilities in a different LGA. In some locations, demand is driven by ramp users from outside of the LGA, particularly if the ramp is in reasonable proximity to desirable boating destinations such as fishing grounds or popular islands.

Additional detail on the determination of the registration distribution is provided in Appendix C. Note that vessel registrations are less in inland LGAs compared to adjacent coastal LGAs.

A summary of the relative geographic contribution of demand to boat ramp facilities located in the Bundaberg Regional Council area is shown in Table 8 below for 2016 registration data.

5.1.2 Registration activation

TMR's approach to the provision of infrastructure for recreational boating is to aim to satisfy average demand rather than peak demand (TMR, 2013).7.

TMR recognises three levels of demand:

- off-peak demand to be met in almost all circumstances
- average demand taken to be demand for a facility on weekends (and for certain regional locations other busy periods)
- peak demand being demand for a facility at peak holiday periods and for special events such as major fishing competitions.

The qualifier on certain regions and circumstances for average demand recognises that in some areas high numbers of shift workers tend to distribute the demand more evenly across each week.

Provision is not made by TMR for peak boating periods such as Christmas, Easter, school holidays, and long weekends. For facilities provided by them, councils and port/water authority managers may choose to cater for higher than average demand.

Research referenced in the previous demand assessment study (GHD, 2011). Indicated that average to high demand was represented by 8% to 14% of registered vessels seeking to use a boat ramp on a typical weekend. This percentage has been termed as "registration activation" for the purposes of this Study.

To better represent the demand within each local government area, refinement of the registration activation percentage considered the following factors as influencing boating popularity over other recreational opportunities:

- incidence of blue collar employment (based on Census data)
- average age of residents (based on Census data)
- remoteness classification by local government area
- whether the LGA is coastal.

Detail on the process for local refinement of registration activation is provided in Appendix C. The adopted parameters for this assessment are summarised in Table 8.

Key observations relevant to the registration activation include a high incidence of older and blue collar workers compared to the state average outside the Bundaberg LGA.

Key observations regarding boat ramp demand relevant to the contributions from the various sources include:

• Population areas within the Bundaberg LGA are largely located close to, or on the coastal side of the Bruce Highway. Most (92%) Bundaberg residents are considered to use

⁷ TMR (2016) Marine Facilities and Infrastructure Plan

⁸ GHD (2011) Recreational Boating Facilities Demand Forecasting Study. Report prepared for TMR, September.

- facilities within the LGA. The remaining 8% are considered to use facilities in Fraser Coast or Gladstone LGAs.
- Some demand for tidal facilities from the inland LGA of North Burnett is funnelled into Bundaberg by virtue of the road network (Isis Highway).
- Although the Buxton facility is on the border of Fraser Coast and Bundaberg LGAs, there
 is no direct road access between Buxton and the Fraser Coast LGA, therefore sharing of
 demand is likely to be low.
- At the northern border of Bundaberg LGA with Gladstone LGA, Baffle Creek has several facilities located on both banks in both LGAs. As such, sharing of demand between Bundaberg and Gladstone is expected to be low.

Table 8 - Contribution to demand for boat ramp facilities, Bundaberg Regional Council

Contributing LGA	% of contributing LGA using Bundaberg facilities*	# of registered vessels from contributing LGA using Bundaberg facilities	% registration activation	Contribution comment
Bundaberg	92%	8458	12%	Resident population Regional centre
North Burnett	15%	122	10%	Hinterland catchment Older, blue collar, regional centre, non-coastal
Fraser Coast	3%	305	12%	Visitation from adjacent coastal LGA Older, blue collar, regional centre
Gladstone	5%	379	10%	Visitation from adjacent coastal LGA Blue collar, regional centre

^{*}See Economic Associates Appendix C for percentage estimates

5.1.3 Demand classifications

The demand by registered vessels has been sub-classified to better align with differing types of destinations:

- Smaller vessels (less than 4.5m in length) are considered to be generally used to access
 protected waters such as creeks and estuaries, and to venture into nearshore waters
 during good weather conditions.
- Larger vessels (between 4.5 and 8m in length) are considered to be generally used to access offshore waters, but seek protected waters during poor weather conditions.
 Depending on the location, some larger vessels are unable to use more tidally restricted facilities in creeks and estuaries.

5.1.4 Boat ramp lane demand

Applying the registration distribution and activation factors to vessel registration data results in an effective quantitative demand for boat ramp lanes within the catchment. This is summarised in Table 9, and shown in terms of small and large vessel demand. Assumptions used in the projections for future growth in demand are provided in Appendix C (Economic Associates report).

Table 9 - Boat ramp lane demand projections, Bundaberg Regional Council

Vessel length	Boat ramp lanes						
	2016	2021	2026	2031	2036		
0 to 4.5m	22	24	25	26	27		
4.5 to 8m	5	6	6	6	7		
Total	27	30	31	32	34		

Key observations relevant to the catchment demand includes that:

- The majority of demand on facilities originates from Bundaberg Regional Council residents.
- Demand from small boats is over four times that of larger boats.
- Growth is forecast to be relatively significant in the next five years, before lessening to a lower but consistent increase from 2021 to 2036.

5.2 Deep-draught vessel landing demand

5.2.1 Local usage and network

Along with private marina facilities, the Burnett Heads Boat Harbour jetty and Targo Street pontoon form part of a network of mainland landings accessible by deep-draught vessels cruising the Queensland coast. Approaching from the south it is approximately 45 nautical miles from Urangan Boat Harbour in Fraser Coast LGA to the Burnett Heads Boat Harbour. The Buxton pontoon is only 25 nautical miles from Urangan Boat Harbour, however while the Burrum River is navigable upstream past Buxton, shoaling at the mouth of the river may limit access on lower tides for some vessels, dependent on vessel draught. The situation is similar at Elliot Heads. From Burnett Heads Boat Harbour to the north, it is approximately 47 nautical miles to the public pontoon at the Town of Seventeen Seventy, in Gladstone LGA. Depending on the weather conditions and seasonal trade winds, Urangan State Harbour and Town of Seventeen Seventy are both within a day's sail of Burnett Heads. The Targo Street pontoon is approximately a further 9.5 nautical miles upstream of the Harbour in Bundaberg CBD.

Given Bundaberg's status as a tourist destination, visiting vessels may choose to stay for more than one night, and therefore will need to seek an overnight protected berth or mooring. Commercial marina facilities cater to this demand, providing landing facilities for their members and for casual visitors. Moorings or berths are generally available at one of the private facilities in Burnett Heads Harbour or at the Bundaberg Port Marina in the Burnett River.

The Targo Street pontoon can be used as a landing for deep-draught vessels but is more often used to secure tenders due to the proximity of the site to the Town Reach anchorage in the Burnett River. The landing offers access to the Bundaberg CBD and is close to supplies and provisions.

The Burnett Heads jetty is located within the State Boat Harbour adjacent to the boat ramp, and is shared with authorised commercial users. There are also marina facilities available and basic provisions within a one kilometre walk.

The Buxton and Elliot Heads pontoons are generally not heavily used by deep-draught vessels and are more frequently used as queuing structures for the adjacent boat ramp.

5.2.2 Landing demand

The projected demand for deep-draught vessel landings within the Bundaberg Regional Council area was assessed by Economic Associates as being driven by the size of the non-trailable fleet. A key difficulty with this assessment is understanding how long visits lasts. It was assumed that demand comprises 5% of the active non-trailable fleet seeking to access a landing. The assessment is shown in Table 10.

Table 10 - Landing demand projections, Bundaberg Regional Council

Evaluation category			Landings		
	2016	2021	2026	2031	2036
# of landings	3	3	3	3	3

6. Development needs and opportunities

The need for additional recreational boating infrastructure within the Bundaberg Regional Council area has been identified by comparing the existing capacity within the area with the expected demand.

6.1 Evaluation of needs

6.1.1 Development priorities

The priorities for development are linked to need and funding cycles, as follows:

Priority 1 (P1) These sites are needed to meet existing demand.

Priority 2 (P2) Assuming that the priority 1 sites are implemented, these sites are expected to be needed to meet additional demand over the five years ending 2021.

Priority 3 (P3) Assuming that the priority 1 and 2 sites are implemented, these sites are expected to be needed to meet additional demand over the subsequent five years, that is 2021 to 2026.

Priority 4 (P4) These sites are those that will meet future demand, but are not expected to be required before 2026 in demand terms but may be brought forward for construction for other reasons.

6.1.2 Quantification of shortfall - boat ramp lanes

The overall demand for boat ramp lanes compared to the effective capacity provided by existing facilities is summarised in Table 11.

Table 11 - Projected boat ramp lane shortfall, Bundaberg Regional Council

Evaluation	Existing	20	16	20	21	20	26	20	36
category	effective capacity*	Demand	Shortfall	Demand	Shortfall	Demand	Shortfall	Demand	Shortfall
All vessels, all facilities	23.2	27	3.8	30	6.8	31	7.8	34	10.8

^{*}Existing effective capacity includes MIIP announced projects/upgrades as at December 2016

However, the provision of additional boat ramp lanes needs to cater to the type of demand to appropriately address that demand. This realistically translates to:

- large (that is 4.5 to 8m) vessels seeking access to open-water
- small (that is <4.5m) vessels not seeking access to open-water.

As there will be some small vessels seeking access to open-water, and some larger vessels not seeking access to open-water, an envelope of projected need has been developed. The best estimate represents the average need within the envelope.

This analysis is shown in Table 12 for facilities classified as providing unhindered open-water access from all-tide or near all-tide facilities, with the envelope of projected need in the Bundaberg LGA based on the following:

upper bound = 100% larger vessels + 50% smaller vessels

lower bound = 90% larger vessels + 30% smaller vessels

Table 12 - Projected boat ramp lane shortfall, open-water access facilities,
Bundaberg Regional Council

Evaluation	Existing	20	16	202	21	20	26	20	36
category	effective capacity *	Demand	Shortfall	Demand	Need	Demand	Shortfall	Demand	Shortfall
Best estimate	10.5	13.5	3	15.3	4.8	15.7	5.2	17.5	7
Upper bound	10.5	16	5.5	18	7.5	18.5	8	20.5	10
Lower bound	10.5	11.1	0.6	12.6	2.1	12.9	2.4	14.4	3.9

^{*}Existing effective capacity includes MIIP announced projects/upgrades as at December 2016

The analysis was also conducted for facilities classified as not providing open-water access, or where water depth or the on-water travel time meant that the facility could not reliably or realistically provide access to open-water (see Table 13). In this analysis, the envelope of projected need in the Bundaberg LGA was based on the following:

upper bound = 70% smaller vessels + 10% larger vessels

lower bound = 50% smaller vessels + 0% larger vessels

^{*}Example of demand calculation: Upper bound 2016 - 100% of larger vessels (Table 9) + 50% of smaller vessels (Table 9) = 5 + 11 = 16

Table 13 - Projected boat ramp lane shortfall, non-open-water access facilities, Bundaberg Regional Council

Evaluation	Existing	20	16	20	21	20	26	20	36
category	effective capacity*	Demand	Shortfall	Demand	Shortfall	Demand	Shortfall	Demand	Shortfall
Best estimate	12.7	13.5	0.8	14.7	2	15.3	2.6	16.5	3.8
Upper bound	12.7	15.9	3.2	17.4	4.7	18.1	5.4	19.6	6.9
Lower bound	12.7	11	-1.7	12	-0.7	12.5	-0.2	13.5	0.8

^{*}Existing effective capacity includes MIIP announced projects/upgrades as at December 2016

There will be some facilities that have been calculated as a "non-open-water access" facility that can, under some circumstances, provide open-water access. However, for the majority of users, access into the local waterway is the primary destination. This also applies to "open-water access" facilities in waterways, where some users will travel upstream into the waterway rather than going offshore.

Given that the majority of demand is driven by Bundaberg Regional Council residents, the location of additional or upgraded facilities should be targeted to service:

- central Bundaberg
- communities along the Burnett River
- regional and coastal communities south of the Burnett River
- regional and coastal communities north of the Burnett River

6.1.3 Quantification of shortfall - deep-draught vessel landings

The assessment of shortfall in landings is shown in Table 14. This assessment indicates that at present the public network in conjunction with the supplementary capacity provided by commercial or club landings is adequate to cater for existing and projected demand, even taking into consideration the relatively low usage of the Buxton and Elliot Heads pontoons as landings.

Table 14 - Projected landing shortfall, Bundaberg Regional Council

E۱	/aluation	Existing	20	2016 2021		2026		2036		
С	ategory	effective capacity*	Demand	Shortfall	Demand	Shortfall	Demand	Shortfall	Demand	Shortfall
la	# of andings*	6	3	-3	3	-3	3	-3	3	-3

^{*}Existing effective capacity includes MIIP announced projects/upgrades as at December 2016

6.2 Identified stakeholder opportunities

Table 15 summarises the key facilities and sites identified by stakeholders during consultation activities as requiring consideration.

^{*#} of landings consists of public sheltered mainland landings, public island landings – supplies available and major private landings

Table 15 - Stakeholder identified opportunities to increase capacity, Bundaberg Regional Council

Facility	Stakeholder comments	Study comments
Walkers Point, Woodgate	Good open-water access. Strong currents. Floating walkway desirable. Limited parking.	Expansion and formalisation of parking and a floating walkway or pontoon is recommended.
Riverview, Elliot Heads	Tide-limited open-water access. Strong currents. Redesign of pontoon due to strong currents desirable.	Alternative site with slower current speeds upstream of the existing facility is recommended.
Powers Street, Buxton	Predominately estuarine access. Limited parking. Redesign of pontoon due to strong currents desirable.	Area available for parking increase is limited. Upgrade of facility not currently recommended.
Woodgate Beach	Beach ramp. Rebuild as an all-weather facility desirable. Floating walkway desirable.	This facility is an open beach ramp and effectively a facility for the local community for use in good weather and suitable tides. Coastal exposure of the site would necessitate harbour scale development to provide suitable sheltering from wind and wave action, and increased depths for all-tide open-water access. The breakwater structures required for ramp protection would need to be of substantial length, and would need to be accompanied by long-term, significant maintenance of local sediment transport to avoid adverse impacts on the adjacent coastline and maintain navigable access. Sheltered all-tide, open-water access provided at Burnett Heads Boat Harbour, which is within one-hour driving
		time. A floating walkway, although desirable, is untenable owing to the wave climate. Upgrade of facility not currently recommended.
Lake Monduran, Gin Gin	Fresh water access. Limited parking. Formalisation of nearby nonformal launch area desirable. Improved accessibility at lower water levels desirable.	Accessibility is highly dependent on variable dam water levels. Parking expansion constrained by geography. Upgrade of facility not currently recommended.

Facility	Stakeholder comments	Study comments
Strathdees Road, Four Knots Point	Excellent open-water access. Redesign of facility desirable. Floating walkway desirable. Area available for parking formalisation.	Facility upgrade including parking formalisation, ramp redesign and a feasibility study to determine the viability of floating infrastructure to act as a queuing facility is recommended.
McGills Road, Kalkie	Good open-water access. Estuarine access. Opportunities for expansion.	Facility upgrade to a 4-lane ramp with parking expansion to achieve 90 CTU spaces is recommended. A feasibility study to determine the viability of a heavy duty pontoon is recommended.
Branyan Drive, Sandy Hook	Fresh water access. Rebuild of facility desirable. Limited parking.	Feasibility study to determine if access can be improved at the ramp is recommended.
Burnett Heads Boat Harbour	Excellent open-water access. Additional parking is desirable.	Parking expansion is recommended.
Queen Street, Bundaberg	Estuarine access. Alternative design to reduce maintenance desirable.	Sufficient overflow parking is available. A floating walkway has been assessed by TMR bridge engineers to be a safety concern due to the proximity to Burnett Bridge in the event of flood breakaway. Upgrade of facility is not currently recommended.
Morts Lane	Formal facility in Littabella Creek desirable. Estuarine access.	Land acquisition required. Establishment of facility not currently recommended.

7. Development priorities

7.1 Methodology for selecting priorities

7.1.1 Boat ramp facilities

The selection of recommended works and their priority level has been considered on several levels. The first level of consideration for increasing boat ramp capacity is founded on two main criteria:

- type of access required open-water or non-open-water
- preference for expansion of existing facilities if suitably located.

Expansion of existing facilities is preferred over the establishment of new facilities in locations where travel times for most users to the existing facilities are not onerous, as road infrastructure for access is already in place and the foreshore is currently allocated to the purpose.

TMR's Marine Facilities and Infrastructure Plan (2016).9 also guides the prioritisation of boating facilities. This plan states that:

"The department favours proposals for boat launching and landing facilities that give access to the open sea at all tides.

Priority will be given to the provision of sheltered all-tide or near all-tide launching facilities giving access to the open sea on an all-tide or near all-tide basis.

Part-tide facilities (for launching or access) may be provided where there is demand, and dredged access is not feasible. For instance, beach access or open beach ramps may be provided where there is sufficient demand and no suitable nearby sheltered waterway." (Section 3.1.1 – Coastal locations – guideline).

"Access channels are not normally provided to open beach boat ramps. Beach access and open beach boat ramps are regarded as part-tide facilities." (Section 6.8 – Dredging of access channels to beach ramps – guideline).

The process used within each LGA identified opportunities to meet the need for ramp lanes for each type of access (open-water/non-open-water) at each of the priority time steps (2016, 2021, 2026 and 2036), is set out in the flowchart in Figure 1. Once the forecast shortfall for ramp lanes for a priority level has been met, further consideration of facilities falls to the next priority level until all forecast shortfall is met.

7.1.2 Deep-draught vessel landings

The criteria for recommended works and priorities for landings comprises:

- the geographical spread of existing facilities
- unserviced destinations and popular anchorages
- access to water of sufficient depth
- access to landside services (shops or transportation) for mainland locations.

In some instances, deep water is not available and so provision for access by tenders or at higher tides is made.

In most instances where demand for additional landings is identified, there are very few locations that satisfy all needs. The prioritisation for these facilities is based on stakeholder perceptions of urgency. From a stakeholder perspective, the demand for landings is all current (that is, now). However, the recommendations have matched the timing of new landings to the demand forecast.

-

⁹ TMR (2016) Marine Facilities and Infrastructure Plan

7.2 Recommended priorities

Table 16 - Recommended priorities to increase capacity, Bundaberg Regional Council area

Priority	Sites
Priority 1 (as soon as possible)	Burnett Heads Boat Harbour – expand parking to achieve 20 additional CTU spaces.
	Strathdees Road, Four Knots Point – conduct a feasibility study to determine if floating infrastructure is viable in this section of the Burnett River. If so, rebuild and widen ramp. Formalise the parking area to achieve 45 CTU spaces.
	Walkers Point, Woodgate – widen ramp to add a floating walkway and formalise parking to achieve 45 CTU spaces.
Priority 2 (over the next five years)	New facility at Elliot Heads – formalise unofficial facility to 2-lanes with a floating walkway and 45 CTU spaces.
Priority 3 (over the next five to ten years)	McGills Road, Kalkie – expand ramp to 4-lanes and increase parking to 90 CTU spaces. Conduct feasibility study to determine if a heavy duty pontoon is viable at the site.
Priority 4 (other)	Sandy Hook – expand parking by 45 additional CTU spaces.
	Booyan Ramp, Moore Park Beach – conduct a feasibility study to determine if the ramp can be reconstructed as near all-tide. If near all-tide access can be achieved, widen ramp to 2-lanes and formalise parking to approximately 30 CTU spaces.

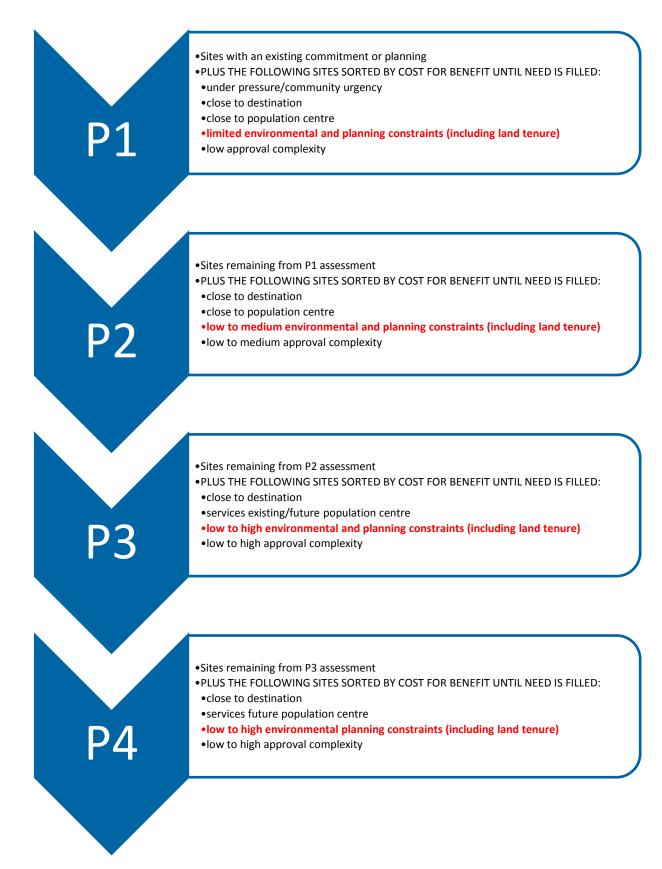

Figure 1 - Priority selection methodology

7.3 Capacity evaluation incorporating development priorities

The effective lane capacity has been reassessed to incorporate the delivery of the recommended development priorities as shown in Table 17, and described in detail in the following sections. The increase in effective lanes gained by each recommendation is shown in the relevant table for that recommendation.

Note that some of the demand for non-open-water access facilities is met by open-water access facilities such as those in the Burnett River, in particular Strathdees Road at Four Knots Point and the Kalkie facility.

Table 17 - Effective lane and landing capacity after delivery of recommended priorities, Bundaberg Regional Council

		20	16	20	21	20	26	20	36
Evaluation category	Existing effective capacity*	Demand	Post- delivery effective capacity *	Demand	Post- delivery effective capacity	Demand	Post- delivery effective capacity	Demand	Post- delivery effective capacity
Open-water access	10.5	13.5	13.5	15	13.5	16	16	17.5	16
Non-open- water access	13	13.5	13	15	15	15	15	16.5	17.5

# of landings*	6	3	6	3	6	3	6	3	6

^{*}Existing effective capacity includes MIIP announced projects/upgrades as at December 2016

^{*}Effective capacities are reported to the nearest 0.5 of a lane

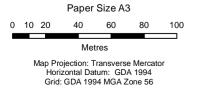

^{*#} of landings consists of public sheltered mainland landings, public island landings – supplies available and major private landings

7.4 Priority 1 sites

Table 18 - Priority 1 - Burnett Heads Boat Harbour

Site name	Burnett Heads, Burnett Heads Boat Harbour				
Existing formal facility?	Yes				
Location	Burnett Heads Boat Harbour				
Current tidal status	All-tide, open-water access				
Site characteristics	Burnett Heads Boat Harbour is located on the southern bank of the mouth of the Burnett River and is accessible via Harbour Esplanade, Burnett Heads. The facility is approximately 1.9km (1 nautical mile) downstream from the Port of Bundaberg Marina. The existing facility contains a 5-lane ramp with 105 CTU spaces available. A floating walkway and public jetty act as queuing structures, with the jetty also available as a landing for deep-draught vessels. Burnett Heads is popular, particularly on fair weather days when the facility can become overcrowded. The facility is particularly popular due to the protected open-water access offered and the depth-maintained marked channel.				
	There are marina facilities available in the Harbour as well as a mooring area, however this area is limited as depths are not maintained in all parts of the Harbour.				
Proposed works	Expand the parking to achieve a further 20 CTU spaces.				
Increase in effective lanes provided by works	1 effective lane				
Rationale	Expansion of parking will increa existing waterside infrastructure				
Environmental and planning constraints	Indigenous Land Use Agreement NNTT Q/2014/088. DATSIP Cultural Heritage Database search recommended. The works are being undertaken in a previously cleared and disturbed area. Developed, non-remnant area. The proposed works are located within the rural zone under the Bundaberg Regional Council Planning Scheme 2015: An MCU is exempt for a 'utility installation' if defined as a 'local utility' in the rural zone. The operational works are exempt from assessment against the local planning scheme as the works would be undertaken by or on behalf of a public sector entity (TMR) (Shd 6 Part 3, Section 8 of P Reg). Reserve tenure.				
Consultation feedback	None received				
Indicative cost (excl. GST)	Water-based infrastructure	\$ -			
(to ±50%)	Land-based infrastructure	\$320,000

Department of Transport and Main Roads Queensland Recreational Boating Demand Study

Job Number | 41-30098 Revision

15 Dec 2016

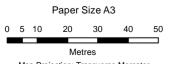

Boating facility Burnett Heads Boat Harbour

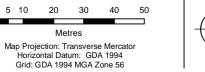

Table 19 - Priority 1 - Strathdees Road, Four Knots Point

Site name	Strathdees Road, Four Knots Point
Existing formal facility?	Yes
Location	Strathdees Road, Four Knots Point, Rubyanna
Current tidal status	Near all-tide, open-water access
Site characteristics	The site is located on the southern bank of the Burnett River at the end of Strathdees Road, Rubyanna.
	The facility is approximately 6.1km (3.3 nautical miles) upstream of the Burnett Heads Boat Harbour and 10.3km (5.5 nautical miles) downstream of the City of Bundaberg.
	The site is located on road Reserve adjacent to the now defunct ferry crossing, with the facility consisting of a narrow 2-lane boat ramp with unformed car park area. The waterside area of the facility lies within port limits of the Port of Bundaberg.
	The existing facility is popular as it provides access to open- water or remain in the estuarine environment of the Burnett River. Access upstream is available as far as the Bundaberg barrage.
	When the Burnett River is in flood, the facility has the potential to become inundated, however a substantial increase in water level would be required for this to occur.
Proposed works	Widen the ramp to achieve 2 lanes of the current standard width. A feasibility study should be undertaken to determine if floating infrastructure is viable in this section of the Burnett River. If viable, the ramp could be further widened to accommodate a queuing structure.
	Formalise the parking area to achieve 45 CTU spaces.
Increase in effective lanes provided by works	1 effective lane
Rationale	The site provides an alternative open open-water access to relieve demand from the Burnett Heads Boat Harbour, while also being located closer to Bundaberg central business district (CBD). The facility has been identified as a popular site and there is sufficient land available for the formalisation of the parking area. There is also sufficient area to expand the waterside
	components to accommodate the addition of a pontoon or floating walkway. Overflow parking is available along the road if required.
	Due to the strong currents that can occur in the Burnett River, especially during flood times, a feasibility study is required to determine if floating infrastructure is viable.
Environmental and planning constraints	Indigenous Land Use Agreement NNTT Q/2014/088. DATSIP Cultural Heritage Database search recommended.
	The works are being undertaken in a previously cleared area mapped as non-remnant vegetation.
	Marine plants may be impacted by the works. Removal of marine plants will require an Operational Works permit for the removal, destruction or damage of marine plants under P Act (Shd 10 Part 17 Item 28 of P Reg). May be accepted development if works can comply with the requirements under Shd 7 Item 8 of the P Reg.
	Operational Works for tidal works or works within a coastal management district is triggered under P Act for the works in the tidal area. Works are considered accepted development under the P Reg Shd 7 Part 3, Item 10 (b) for tidal works that is undertaken by TMR. Accepted development works are to

Site name	Strathdees Road, Four Knots F	Point				
	comply with the requirements for the work prescribed under the Coastal Act, Section 167(5)(b).					
	activities for dredging more that	Environmental Relevant Activity 16 extracting and screening activities for dredging more than 1000 tonnes of material in a year may be triggered depending on works (P Reg Shd 10, Part 5, Div 2, Item 1).				
	The proposed works are located within the rural zone under the Bundaberg Regional Council Planning Scheme 2015: An MCU is exempt for a 'utility installation' if defined as a 'local utility' in the rural zone. An MCU is exempt for a 'landing' in the rural zone.					
	The operational works are exempt from assessment against the local planning scheme as the works would be undertaken by or on behalf of a public sector entity (TMR) (Shd 6 Part 3, Section 8 of P Reg).					
	Road reserve and unallocated state land.					
Consultation feedback	None received					
Indicative cost (excl. GST) (to ±50%)	Water-based infrastructure	Dependent on outcome of feasibility study				
(excludes feasibility study)	Land-based infrastructure	\$1,740,000

15 Dec 2016

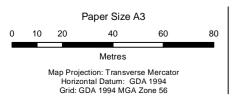

Boating facility Strathdees Road, Four Knots Point

Table 20 - Priority 1 - Walkers Point, Woodgate

Site name	Walkers Point, Woodgate
Existing formal facility?	Yes
Location	Walkers Point, Woodgate
Current tidal status	Near all-tide, open-water access
Site characteristics	The site is located on Manley Smith Drive in Walkers Point, Woodgate on the northern bank of the Burrum River. The facility consists of a 2-lane ramp with an unformed parking area. No queuing structures are provided, but a sandy beach is accessible at higher tides. The facility is protected from significant open-water wind and wave action due to its position within the Burrum River. The site offers an alternative location to the open beach ramp at Woodgate as it is located approximately 12km from Woodgate via road and approximately 20.5km (11 nautical miles) south of the Woodgate open beach ramp via water.
Proposed works	Widen the existing boat ramp to allow for the addition of a floating walkway and formalise the parking area to achieve 45 CTU spaces.
Increase in effective lanes provided by works	1 effective lane
Rationale	The site provides access to the open-water as well as the Burrum River, providing the opportunity for a variety of destinations and uses. There is sufficient land available at the site for formalisation of parking and waterside expansion to accommodate a floating walkway. There is also area for overflow parking along the road as required. The beach ramp at Woodgate has a coastal exposure that would require a safe harbour scale development to provide suitable protection from wind and wave action, hence the Walkers Point facility is preferable for augmentation. Confirmation that a floating walkway is suitable to withstand the current speeds in the River will be required.
Environmental and planning constraints	Nationally important wetland – Burrum Coast - If the works are likely to impact on MNES, a referral under the EPBC Act must be made to DEE. Within a wetland protection area (WPA) trigger area. SDAP Module 11 will apply to all works triggering under the P Act which are high impact earthworks in a WPA. Category B (remnant); mapped as least concern RE 12.2.11. Exemptions apply for clearing native vegetation on land generally that is clearing for the construction or maintenance of community infrastructure mentioned in Shd 21, Part 1, Section 14 (b) of P Reg that is government supported transport infrastructure. Marine plants may be impacted by the works. R Removal of marine plants will require an Operational Works permit for the removal, destruction or damage of marine plants under P Act (Shd 10 Part 17 Item 28 of P Reg). May be accepted development if works can comply with the requirements under Shd 7 Item 8 of the P Reg. Operational Works for tidal works or works within a coastal management district is triggered under P Act for the works in the tidal area. Works are considered accepted development under the P Reg Shd 7 Part 3, Item 10 (b) for tidal works that is undertaken by TMR. Accepted development works are to

22 Dec 2016

Boating Facility Walkers Point, Woodgate

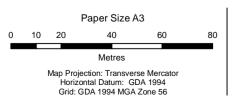

7.5 Priority 2 sites

Table 21 - Priority 2 - Hall Street, Elliott Heads

Site name	Hall Street, Elliott Heads
Existing formal facility?	No
Location	Corner of Hall street and McIntosh Avenue, Elliott Heads
Current tidal status	Near all-tide, depth-limited open-water access
Site characteristics	Currently, the site is an informal launch facility with an unformed car parking area. It is located approximately 500m upstream of the existing Riverview facility on the same Reserve, however is unlikely to experience currents of the same strength as at the Riverview facility. The Elliott River is tide-limited at the mouth by highly mobile sand bars, which require local knowledge to navigate safely, therefore this site is predominately for estuarine access.
Proposed works	Construction of a 2-lane ramp with a floating walkway. Formalisation of car park to achieve 45 CTU spaces.
Increase in effective lanes provided by works	2 effective lanes
Rationale	The site allows expansion of capacity in the Elliot Heads area while still retaining the park area bordering the existing Elliot Heads facility. The site would also be less exposed to strong currents, allowing safer launch/retrieval manoeuvres, and has a sandy beach as an additional queuing area if required.
Environmental and planning constraints	Native title NNTT QC1999/020-3 Gurang People over the site has been accepted for registration. DATSIP Cultural Heritage Database search recommended.
	The majority of the site is previously cleared with Category X, non-remnant vegetation. The proposed works extend into Category B remnant vegetation, RE 12.5.4. Exemptions apply for clearing native vegetation on land generally that is clearing for the construction or maintenance of community infrastructure mentioned in Shd 21, Part 1, Section 14 (b) of P Reg that is government supported transport infrastructure. Marine plants are unlikely to be impacted by the works.
	Removal of marine plants will require an Operational Works permit for the removal, destruction or damage of marine plants under P Act (Shd 10 Part 17 Item 28 of P Reg). May be accepted development if works can comply with the requirements under Shd 7 Item 8 of the P Reg.
	Operational Works for tidal works or works within a coastal management district is triggered under P Act for the works in the tidal area. Works are considered accepted development under the P Reg Shd 7 Part 3, Item 10 (b) for tidal works that is undertaken by TMR. Accepted development works are to comply with the requirements for the work prescribed under the Coastal Act, Section 167(5)(b).
	Environmental Relevant Activity 16 extracting and screening activities for dredging more than 1000 tonnes of material in a year may be triggered depending on works (P Reg Shd 10, Part 5, Div 2, Item 1).
	FHA management area A is located in the site area. The walkway may protrude into the area. Operational work completely or partly in a declared fish habitat area is assessable development, unless the work is accepted development under shd 7, part 3, section 7 of the P Reg. Marine Park Permits may be required for any works that occur within the Great Sandy Marine Park.
	occal within the Great Gardy Manne Lark.

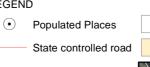

Site name	Hall Street, Elliott Heads					
	The proposed works are located within the open space zone under the Bundaberg Regional Council Planning Scheme 2015: An MCU is exempt for a 'utility installation' if defined as a 'local utility' in the open space zone. An MCU is exempt for a 'landing' in the open space zone.					
	The operational works are exempt from assessment against the local planning scheme as the works would be undertaken by or on behalf of a public sector entity (TMR) (Shd 6 Part 3, Section 8 of P Reg).					
Consultation feedback	Reserve tenure. None received

7.6 Priority 3 sites

Table 22 - Priority 3 - McGills Road, Kalkie

Site name	McGills Road, Kalkie
Existing formal facility?	Yes
Location	McGills Road, Kalkie
Current tidal status	All-tide, open-water access
Site characteristics	The site is located on the south bank of the Burnett River on McGills Road near Kalkie. It is approximately 5.2km (2.8 nautical miles) downstream of the Burnett Bridge in Bundaberg. The facility provides access to the Burnett River as far upstream as the Bundaberg barrage. When the Burnett River is in flood, the facility has the potential to become inundated, however a substantial increase in water level would be required for this to occur.
	The existing facility is located on road reserve, which extends to the north and south of the existing facility.
Proposed works	Increase the ramp from 2-lanes to 4-lanes. Expand the parking to achieve 90 CTU spaces (an additional 70 CTU spaces). Conduct a feasibility study to determine if a heavy duty pontoon is viable in this section of the Burnett River.
Increase in effective lanes provided by works	2.5 effective lanes
Rationale	The ramp provides an alternative open open-water access to relieve demand from the Burnett Heads Boat Harbour facility whilst also providing estuarine access for smaller boats and during inclement weather. There is sufficient room to expand the waterside infrastructure and landside CTU parking.
	Due to the location of a submerged rock training wall in the Burnett River, under flood flows rocks from the wall may be dislodged and could impact the facility. A feasibility study to determine if a heavy duty pontoon is viable is required, particularly in relation to dislodged rocks and flood loads.
Environmental and planning constraints	Native title NNTT QC1999/020-3 Gurang People over the site has been accepted for registration. DATSIP Cultural Heritage Database search recommended.
	The majority of the site is previously cleared with Category X, non-remnant vegetation. The proposed works extend into Category B remnant vegetation, RE 12.5.4. Exemptions apply for clearing native vegetation on land generally that is clearing for the construction or maintenance of community infrastructure mentioned in Shd 21, Part 1, Section 14 (b) of P Reg that is government supported transport infrastructure. Marine plants are unlikely to be impacted by the works. Removal of marine plants will require an Operational Works permit for the removal, destruction or damage of marine plants under P Act (Shd 10 Part 17 Item 28 of P Reg). May be accepted development if works can comply with the requirements under Shd 7 Item 8 of the P Reg. Operational Works for tidal works or works within a coastal management district is triggered under P Act for the works in the tidal area. Works are considered accepted development under the P Reg Shd 7 Part 3, Item 10 (b) for tidal works that is undertaken by TMR. Accepted development works are to comply with the requirements for the work prescribed under the Coastal Act, Section 167(5)(b).

Site name	McGills Road, Kalkie					
	Environmental Relevant Activity 16 extracting and screening activities for dredging more than 1000 tonnes of material in a year may be triggered depending on works (P Reg Shd 10, Part 5, Div 2, Item 1).					
	The proposed works are located on unallocated state land. The adjacent land is zoned as rural under the Bundaberg Regional Council Planning Scheme 2015: An MCU is exert for a 'utility installation' if defined as a 'local utility' in the ruzone. An MCU is exempt for a 'landing' in the rural zone.					
	The operational works are exempt from assessment against the local planning scheme as the works would be undertaken by or on behalf of a public sector entity (TMR) (Shd 6 Part 3, Section 8 of P Reg).					
	Marine Park Permits may be required for any works that occur within the Great Sandy Marine Park.					
	Unallocated state land.					
Consultation feedback	None received					
Indicative cost (excl. GST)	Water-based infrastructure	\$700,000				
(to ±50%) (excludes feasibility study)	Land-based infrastructure	\$2,200,000

7.7 Priority 4 sites

Table 23 - Priority 4 - Sandy Hook Road, Branyan

Site name	Sandy Hook Road, Branyan
Existing formal facility?	Yes
Location	Sandy Hook Road, Branyan
Current tidal status	Fresh water
Proposed works	Expand the parking by an additional 45 CTU spaces
Increase in effective lanes provided by works	1.5 effective lanes
Rationale	The Sandy Hook facility currently consists of two 2-lane ramps with only 10 shared CTU spaces. Expansion of the parking will assist in increasing the efficient usage of the existing waterside infrastructure. The facility also provides fresh water access, offering an
	alternative recreational boating environment.

Boating facility Sandy Hook Road, Branyan

Table 24 - Priority 4 - Booyan boat ramp, Baillies Road, Moore Park Beach

Site name	Booyan boat ramp, Baillies Road, Moore Park Beach			
Existing formal facility?	Yes			
Location	Baillies Road, Moore Park Beach, east bank of the Kolan River			
Current tidal status	Part-tide, depth-limited open-water access			
Proposed works	Feasibility study to determine if lengthening the ramp will improve tidal access (near all-tide).			
	If improved access can be achieved, widen ramp to 2-lanes and formalise parking to approximately 30 CTU spaces			
Increase in effective lanes provided by works	Up to 1.1 effective lanes			
Rationale	The facility provides access into the Kolan River for boat users on the eastern bank.			
	Near all-tide access will improve capacity and create a more user-friendly facility, potentially attracting users and reducing demand at other congested facilities.

1 INTRODUCTION

1.1 Purpose of study

Economic Associates (as a sub consultant to GHD Pty Ltd) were engaged by the Department of Transport and Main Roads (TMR) to undertake an assessment of the demand for recreational boating facilities at the local government area (LGA) level. Demand projections have been prepared at five year intervals to 2036 (that is, 2016, 2021, 2026, 2031 and 2036) and take into account current and future demand for recreational boat ramps and landings.

This study represents an update to the Recreational Boating Facilities Demand Forecasting Study 2016, taking into account 2016 Census data.

1.2 Report structure

The report has been structured as follows:

- Section 1: Introduction: Provides an outline of the purpose of the study and report structure
- Section 2: Projected size of recreational boating fleet: Provides an overview of the assumptions utilised in preparing estimates of the projected recreational boating fleet by LGA
- Section 3: Infrastructure demand assessment: Provides an overview of the assumptions
 utilised in preparing estimates of the demand for new or upgraded boat ramps and landings by
 LGA
- Section 4: References: Provides a summary of the references utilised in preparing this report.

1.3 Disclaimer

This report is based on the most up to date readily available information. Sources are documented in the report. Economic Associates has applied due professional care and diligence in accordance with generally accepted standards of professional practice in undertaking analysis and interpretation of source information. Economic Associates is not liable for damages arising from any errors or omissions arising from use of these information sources.

As this report involves future projections which can be affected by a number of unforeseen circumstances, it represent our best possible estimates and no warranty is given that these particular projections will eventuate.

2 PROJECTED SIZE OF RECREATIONAL BOATING FLEET

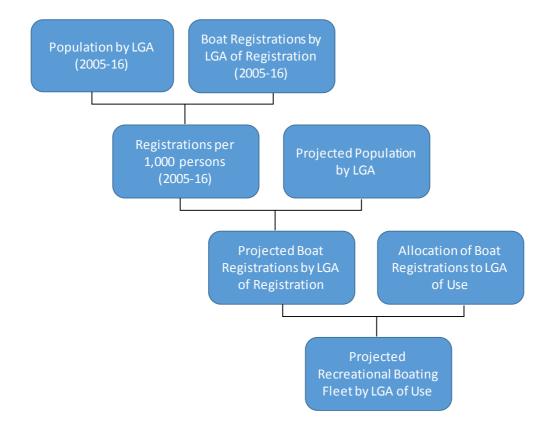

This section of the report provides a summary of the projected size of the recreational boating fleet by LGA, including a detailed explanation relating to the assumptions made in preparing the projections.

2.1 Methodology

In estimating the projected size of the recreational boating fleet, the assessment has made a number of assumptions relating to the current and projected size of the trailable and non-trailable fleet and the relationship between LGA of registration and LGA of waterway/facility use.

Figure 2.1 below outlines the methodology utilised in preparing the projected size of the recreational boating fleet by LGA of use.

Figure 2.1: Methodology utilised in projecting recreational boating fleet by LGA of use

2.2 Assumptions

2.2.1 Current size of recreational boating fleet

TMR provided data relating to historical boat registrations for the 2005 to 2016 period for the following categories:

- · sail boats
- boats without sails, including:
 - motor boats without sails
 - speed boats
 - jet skis (or personal watercraft).

The data was provided by LGA of registration. This data was used to generate historical estimates of the size of the trailable and non-trailable boat fleet for each LGA, including the following sub-categories:

- trailable fleet, which comprises the following sub-categories:
 - boats up to 4.5 metres in length (including jet skis)
 - boats 4.5 8 metres in length
- non-trailable fleet (vessels most likely to be berthed at marinas or private moorings).

The trailable boat fleet has been estimated for two sub-classes to identify vessels that tend to be used inshore (vessels up to 4.5 metres in length) versus vessels which have the ability to travel offshore (vessels 4.5 – 8 metres in length). The 4.5 metre cut-off length was identified through consultation with LGA and port/water storage officers undertaken by GHD as part of this study, and confirmed by TMR officers as being reasonable and accepted for intended uses of the study.

Table 2.1 below summarises our assumptions in relation to the split of trailable boats and non-trailable boats based on the data provided by TMR. This assessment assumes that all boats greater than eight metres in length are non-trailable and that all jet skis are within the trailable boat fleet.

The incidence of trailable and non-trailable boats eight metres or less in length is consistent with the assumptions made in the Recreational Boating Facilities Demand Forecasting Study 2011.

Table 2.1: Estimated proportion of trailable and non-trailable boats, 2005-2016

Length	Trailable		Non-trailable		
	sail boats	Boats without sail	Sail boats	Boats without sail	
<3 metres	100.0%	100.0%	0.0%	0.0%	
3-5 metres	90.0%	100.0%	10.0%	0.0%	
5-8 metres	50.0%	85.0%	50.0%	15.0%	
8-10 metres	0.0%	0.0%	100.0%	100.0%	
10-12 metres	0.0%	0.0%	100.0%	100.0%

Source: Economic Associates estimates

In 2016, there were 996 vessel registrations that were not assigned to an LGA in Queensland¹, comprising 983 interstate registrations, five overseas registrations and eight unknown registrations. For this assessment, the following assumptions have been made for the allocation of these registrations to the trailable and non-trailable boat fleets:

- Interstate registrations: Interstate registrations have been allocated in the manner outlined in Table 2.1 above, as it is considered likely that the majority of interstate registrations of a trailable length are within northern NSW.
- Overseas and unknown registrations: The assessment has assumed that all overseas and unknown registrations are of a non-trailable nature.

Based on the assumptions presented in Table 2.1 above and the allocation of interstate, overseas and unknown registrations, the estimated size of the recreational boating fleet in Queensland was 279,586 vessels in 2016, comprising:

- 184,835 trailable boats up to 4.5 metres in length (including jet skis)
- 73,462 trailable boats 4.5 8 metres in length
- 21,289 non-trailable boats.

Not surprisingly, the size of the recreational boating fleet was highest in a number of South-east Queensland councils, Mackay Regional Council, Townsville City Council, and Cairns Regional Council.

Table 2.2 below presents the estimated size of the recreational boating fleet in Queensland and each of the component LGAs in 2016.

Note: All registrations with an overseas or unknown address were classified as non-trailable as they were likely to be stored in marinas or dry storage facilities. Source: Economic Associates estimates based on data provided by TMR.

2.2.2 Historical incidence of boat ownership

To determine the projected number of boat registrations in each LGA, the boat registration data, in conjunction with historical population data, has been analysed to calculate the historical incidence of boat ownership (that is, the number of boat registrations per 1,000 persons). The historical incidence of boat ownership was calculated for the trailable and non-trailable fleets, as defined in Section 2.1.1 above.

In the 2005 to 2016 period, the average incidence of boat ownership was as follows:

- trailable boats up to 4.5 metres in length (including jet skis): 0.00 140.93 boats/1,000 persons
- trailable boats 4.5 8 metres in length: 0.26 81.45 boats 1,000 persons
- non-trailable boats: 0.00 22.39 boats/1,000 persons.

The historical incidence of boat ownership is highest in coastal communities such as Hinchinbrook Shire, Burdekin Shire, Cook Shire, Douglas Shire, Cassowary Coast, Livingstone Shire, Town of Weipa, and Whitsunday. Of these coastal communities, only Cook Shire recorded a decline in the incidence of boat ownership between 2005 and 2016.

Table 2.3 below summarises the average historical incidence of boat ownership by vessel class in the 2005 to 2016 period, by LGA.

Table 2.3: Historical incidence of boat ownership (registrations / 1,000 persons) by LGA, 2005-2016

2.2.3 Projected population by LGA

To project boat registrations by LGA, this analysis assumes that the incidence of new boat registrations post 2016 is consistent with the 2005-2016 average (as outlined in Table 2.3 above).

The assessment has relied on the latest projections prepared by the Queensland Government Statistician's office (Queensland Government 2015, Population Projections by LGA, medium series), rebased to take into consideration the 2016 population estimates published by the Australian Bureau of Statistics (released subsequent to the 2016 Census of Population and Housing).

Table 2.4 below outlines the projected population of each LGA in Queensland.

Table 2.4: Projected population by LGA, medium series, 2016-2036

2.3 Projected size of recreational boating fleet

2.3.1 Projected size of fleet by LGA of registration

Based on the assumptions outlined above, the projected size of the recreational boating fleet registered in Queensland is projected to increase from 279,586 boats in 2016 to 381,988 boats in 2036, with the composition in 2036 anticipated to be as follows:

- 251,600 trailable boats up to 4.5 metres in length
- 100,795 trailable boats 4.5 8 metres in length
- 29,594 non-trailable boats.

Growth in the number of registrations is anticipated to be highest in a number of South-east Queensland councils, Cairns Regional Council, Townsville City Council and Mackay Regional Council.

Table 2.5 below summarises the projected size of the recreational boating fleet in Queensland by LGA of registration, between 2016 and 2036.

2.3.2 Allocation of recreational boating fleet to LGA of use

The projected recreational boating fleet estimates presented in Table 2.4 above outline the projected number of boat registrations in each LGA in Queensland, that is, the number of boat registrations by place of residence. However, boat owners may utilise their boat in multiple LGAs, including LGAs other than their place of residence.

In allocating boat registrations to LGA of use, the assessment undertook a review of the distribution of boating infrastructure throughout Queensland and was informed by consultation with LGA and port/water storage officers undertaken by GHD as part of this project.

Two matrices were compiled which outline the distribution of boat registrations to the relevant LGA/s of use, one for trailable boat registrations and the other for non-trailable boat registrations. These two matrices are presented in Appendix A.

In the case of trailable boat registrations, allocations were made only to those LGAs with identified public boating infrastructure. Based on information provided by GHD, the following LGAs in Table 2.6 did not appear to have any public boating infrastructure, and hence were not allocated any boat registrations for use in that LGA.

2.3.3 Projected size of fleet by LGA of use

Based on 2016 data, the size of the recreational boating fleet in Queensland is projected to increase from 272,472 boats in 2016 to 371,328 boats in 2036. The size of the recreational boating fleet in Queensland is approximately 3% lower than total boats registered in Queensland

as a result of vessel registration leakage, predominantly from the Gold Coast to northern New South Wales.

A number of LGAs are anticipated to record significant registration inflows, including:

- Redland City Council (net inflow of 8,740 vessels in 2016, increasing to 14,247 vessels in 2036)
- Gold Coast City Council (net inflow of 4,594 vessels in 2016, increasing to 7,844 vessels in 2036)
- Somerset Regional Council (net inflow of 3,075 vessels in 2016, increasing to 3,697 vessels in 2036)
- Sunshine Coast Regional Council (net inflow of 1,966 vessels in 2016, increasing to 2,314 vessels in 2036)
- Hinchinbrook Shire Council (net inflow of 1,894 vessels in 2016, increasing to 2,858 vessels in 2036)
- Scenic Rim Regional Council (net inflow of 1,559 vessels in 2016, increasing to 1,608 vessels in 2036)
- Cassowary Coast Regional Council (net inflow of 1,131 vessels in 2016, increasing to 1,350 vessels in 2036).

Table 2.8 below summarises the projected size of the recreational boating fleet by LGA of use, between 2016 and 2036.

3 INFRASTRUCTURE DEMAND ASSESSMENT

This section converts recreational boating fleet projections into infrastructure demand projections for boat ramp lanes and landings (i.e. publically accessible deep-draught vessel pontoons) at the LGA level.

In determining infrastructure demand, the assessment estimates the likely number of boats being utilised on a day of average demand. This estimate is described as the active fleet. From here, assumptions are made relating to the relationship between trailable boats and boat ramp lane demand, and the relationship between non-trailable boats and likely landings demand.

Figure 3.1 below outlines the methodology utilised to calculate boat ramp lane and landings demand.

Figure 3.1: Methodology to calculate boat ramp lane and landings demand at the LGA level

3.1 Size of active fleet assumptions

3.1.1 Registration activation rate

TMR recognises three levels of demand for marine facilities, namely:

- off-peak demand typical weekday usage
- average demand taken to be demand for a facility on weekends (and, for certain regional locations, other busy periods)
- peak demand demand for a facility at peak holiday periods or for special events.

The Recreational Boating Facilities Demand Forecasting Study 2011 identified the proportion of the recreational boating fleet likely to use boating facilities for each level of demand (referred to herein as the registration activation rate):

• off-peak demand: 8%

average demand: 14%

peak demand: 20%.

TMR policy on catering for marine facility demand is as follows:

TMR expects off-peak demand at a given facility to be met in almost all circumstances. Its program of works is aimed at satisfying average demand.

TMR does not cater for peak demand. This is because funds (provided largely by collection of recreational boat registration fees) are stretched meeting demand for basic marine infrastructure such as dredging, landings, breakwaters and boat ramps around the state, and local managing authorities cannot allocate sufficient resources (land and funds) for peak demand days. Scarce foreshore land is in intense demand for other purposes, as is funding.

An initial assessment of demand identified that applying the average demand activation rate statewide substantially overestimated the current and projected demand for facilities in some LGAs, based on complaints and observed levels of congestion at various facilities in those LGAs.

Therefore, unlike the *Recreational Boating Facilities Demand Forecasting Study 2011*, this study has considered differing registration activation rates by LGA.

This approach has been taken to recognise that the level of boat usage is likely to differ by LGA, depending on a range of factors, including access to recreational boating facilities, the range of recreational activities other than boating available to the community, the recreational time available to boat users (for example, retirees are likely to have more available time to undertake boating activities than persons employed on a fulltime basis), and nature of employment (for example, persons who finish work in the early afternoon are likely to have more available time to undertake boating activities than persons who finish work in the evening).

The consultation with LGA and port/water storage managers undertaken by GHD as part of this study indicated that recreational boaters typically use their boat to go fishing. A literature review was undertaken to identify the socio-economic and demographic characteristics of persons who participated in recreational fishing.

Ormsby, Jayne (2004) undertook a survey to identify the social, motivational and experiential aspects of recreational fishing by anglers from Queensland. The survey identified that just under

a quarter of respondents were classified as tradespersons and related workers, significantly higher than any other occupational class.

The Australian Bureau of Statistics (ABS) (2010) considers the participation rate of Australians in a number of sports, including fishing. This research identified that the participation rate for fishing was highest for the 55-64 year age cohort, followed by the 45-54 year age cohort. Interestingly, this result directly contradicts the findings of Department of Agriculture and Fisheries (2014), which identifies recreational fishing participation rates as being highest for the 5-14 year age cohort, and lowest for the 60+ year age cohort.

Participation rates in both studies represent the proportion of persons that participate in fishing in a given year, but do not provide insight as to the frequency of participation in that year. This means that while a certain age cohort may have a high participation rate, these persons may only go fishing once a year, while other age cohorts might have lower participation rates but higher frequency of participation. The literature review did not identify any information in relation to the frequency of participation in fishing or recreational boating by age cohort.

Our assessment has assumed that a higher average age is likely to correspond with a higher frequency of recreational boat usage, due to the greater availability of time for recreational pursuits, such as fishing and boating.

Within each LGA, the following factors were considered in refining the appropriate registration activation rate.

- incidence of blue collar employment (based on 2016 Census)
- average age of residents (based on 2016 Census)
- remoteness classification by local government area (Accessibility/Remoteness Index of Australia (ARIA+))
- whether the LGA was coastal.

ARIA+ is an index of remoteness derived from measures of road distances between populated localities to each of five categories of service centre, namely:

- distance between populated locality and population centre of 250,000+ persons
- distance between populated locality and population centre of 48,000-249,999 persons
- distance between populated locality and population centre of 18,000-47,999 persons
- distance between populated locality and population centre of 5,000-17,999 persons
- distance between populated locality and population centre of 1,000-4,999 persons.

The five distance measurements, one to each level of service centre, is recorded for each populated locality and standardised to a ratio. The ratio is calculated by dividing the measured distance for a given locality by the Australian average (mean) for that category. After applying a threshold of three to each of the ratios, all ratios are summed to produce the ARIA+ score for each populated locality across Australia. An interpolation procedure is then used to derive the index values for larger geographic areas such as LGAs.

ARIA+ is the endorsed measure of remoteness utilised by the ABS.

The fit between the ARIA+ remoteness classifications and our classification is summarised in Table 3.1 below.

Table 3.1: Fit between ARIA+ remoteness classification and EA classification

ARIA+ remoteness classification	EA classification
Highly accessible / accessible	Metropolitan
Moderately accessible	Regional centre
Remote	Remote
Very remote	Very Remote

To determine the appropriate registration activation rate, the following steps were taken:

- All LGAs with an ARIA+ classification of highly accessible or accessible (we have called metropolitan) were assigned a registration activation rate of 8%.
- All LGAs with an ARIA+ classification of moderately accessible (we have called regional centre) were assigned a registration activation rate as follows:
 - If the LGA has a higher incidence of blue collar workers and a higher average age than Queensland – registration activation rate is 12%.
 - For all other LGAs registration activation rate is 10%.
- All LGAs with an ARIA+ classification of remote were assigned a registration activation rate as follows:
 - If the LGA has a higher incidence of blue collar workers and a higher average age than Queensland – registration activation rate is 14%.
 - All other LGAs registration activation rate is 12%.
- All LGAs with an ARIA+ classification of very remote were assigned a registration activation rate of 14%.

After completing this first assessment, the registration activation rates were then adjusted to reflect whether the LGA was coastal or not. If the LGA was coastal, the registration activation rate remained unchanged. However, if the LGA was non-coastal, the registration activation rate was adjusted downwards by 2% (for example, if the registration activation rate was 12% and the LGA was non-coastal, the adjusted activation rate was 10%). This adjustment was made to reflect the extra travel distance required to access recreational boating facilities relative to persons who resided in coastal LGAs. It is considered that the further a person has to travel to access recreational boating facilities, the less often these facilities will typically be utilised. If the registration activation rate was already 8%, the rate remained unchanged.

A further reduction in activation was applied to a number of coastal LGAs in South-east Queensland with a broad offering of recreational activities, including boating, where it was determined that the appropriate registration activation rate was in the order of 6%-7%.

Based on the above criteria, Table 3.2 below summarises the activation rates applied to each LGA in Queensland.

3.1.2 Tourism Adjustment

The following LGAs were considered to record a significant uplift in boating infrastructure demand as a result of tourism activity:

- first tier LGAs:
 - Douglas Shire
 - Cairns Regional Council
 - Whitsunday Regional Council
- second tier LGAs:
 - Townsville City Council
 - Fraser Coast Council
 - Mackay Regional Council
 - Livingstone Shire Council.

The assumed uplift in boat lane demand was assumed to be as follows:

- first tier LGAs: 20% uplift in boat ramp lane and pontoon/landing demand
- second tier LGAs: 10% uplift in boat ramp lane and pontoon/landing demand.

Consultation also identified that the northern coastal LGAs of Burke, Cook and Carpentaria Shire record significant increases in demand for boating infrastructure during winter, with significant inflows of grey nomads. However, it was also identified that boating infrastructure within these LGAs was more than sufficient to accommodate these inflows.

3.2 Projected size of active fleet

Based on the above assumptions, the projected size of the active fleet in Queensland on a day of average demand is projected to increase from 24,298 vessels in 2016 to 32,524 vessels in 2036.

The size of the active fleet on a day of average demand is anticipated to be largest in the following LGAs, reflecting the large population residing in the South-east Queensland area:

- Gold Coast City Council (2,442 vessels in 2016, increasing to 3,764 vessels in 2036)
- Moreton Bay Regional Council (1,628 vessels in 2016, increasing to 2,268 vessels in 2036)
- Brisbane City Council (1,480 vessels in 2016, increasing to 1,969 vessels in 2036)
- Redland City Council (1,314 vessels in 2016, increasing to 1,803 vessels in 2036)
- Sunshine Coast Regional Council (1,195 vessels in 2016, increasing to 1,783 vessels in 2036).

Table 3.3 below summarises the size of the active fleet on a day of average demand between 2016 and 2036.

3.3 Relationship between active fleet and boating infrastructure demand

3.3.1 Conversion of active trailable fleet to boat ramp lane demand

Converting active trailable fleet estimates into boat ramp lane demand has been undertaken based on throughput rates of ramps. In SKM (1988) and Rose et. al. (2009), a rate of 30 boats per lane per day is considered to provide unhampered overall amenity, whereas a rate of 50 boats per lane per day represents congested operations.

It has been assumed that the midpoint (40) between unhampered overall amenity (30 boats per lane per day) and congested operations (50 boats per lane per day) would represent the ideal scenario, as it balances the needs and wants of trailable boat owners against the costs incurred by local governments, port authorities, water storage managers, state governments and the private sector in providing boat ramps.

This assumption is consistent with the assumption made in the Recreational Boating Facilities Demand Forecasting Study 2011.

3.3.2 Relationship between active non-trailable fleet and pontoon/landing demand

The literature review did not uncover any literature relating to public pontoon/landing demand.

Public pontoon/landing demand is driven by the size of the non-trailable fleet. The assessment has assumed that on a given day, an estimated 5% of the active non-trailable fleet is anticipated to demand a public pontoon/landing.

3.4 Projected boat ramp lane demand

Total boat ramp lane demand in Queensland is projected to increase from 563 lanes in 2016 to 757 lanes in 2036 (refer to Table 3.4 below). The LGAs anticipated to record the highest demand for boat ramps are:

- Gold Coast City Council (54 boat ramp lanes in 2016, 83 boat ramp lanes in 2036)
- Moreton Bay Regional Council (38 boat ramp lanes in 2016, 52 boat ramp lanes in 2036)
- Brisbane City Council (33 boat ramp lanes in 2016, 44 boat ramp lanes in 2036)
- Redland City Council (30 boat ramp lanes in 2016, 42 boat ramp lanes in 2036)
- Mackay Regional Council (34 boat ramp lanes in 2016, 46 boat ramp lanes in 2036)
- Fraser Coast Regional Council (34 boat ramp lanes in 2016, 44 boat ramp lanes in 2036)
- Cairns Regional Council (33 boat ramp lanes in 2016, 45 boat ramp lanes in 2036)
- Townsville City Council (29 boat ramp lanes in 2016, 42 boat ramp lanes in 2036)
- Sunshine Coast Regional Council (28 boat ramp lanes in 2016, 42 boat ramp lanes in 2036)
- Bundaberg Regional Council (27 boat ramp lanes in 2016, 34 boat ramp lanes in 2036).

Table 3.4 below identifies that some LGAs have demand for less than one boat ramp lane. These LGAs currently have either little or no public boating infrastructure but recorded vessel registrations.

Table 3.4: Projected boat ramp lane demand by LGA, 2016-2036

3.5 Projected pontoon/landing demand

In Queensland, total pontoon/landing demand is projected to increase from 87 pontoons/landings in 2016 to 121 pontoons/landings in 2036.

The LGAs anticipated to have the most significant demand for pontoons/landings are Gold Coast City, Brisbane City, Redland City, Sunshine Coast Regional Council, Cairns Regional Council, Fraser Coast Regional Council and Whitsunday Regional Council.

Table 3.5 below summarises the projected pontoon/landing demand by LGA between 2016 and 2036.

Table 3.5: Projected pontoon / landing demand by LGA, 2016-2036
